

SUSTAINABILITY

We think green

At 65 Queen's Gate, we are committed to working in a sustainable way. We are continually improving our venue and looking for ways to ensure our facilities and processes are kind to the environment, whilst maintaining our standard of remarkable events that meet the needs of our clients. 65 Queen's Gate is adopting the following sustainable approach across the venue:

LIGHTING

Low energy LED lights and motion sensors have been installed throughout the venue. LED lighting has a much longer life span than traditional lighting, which results in less waste as well as considerable energy savings.

CATERING

Our catering partner, Eden Caterers, have been awarded with the highest possible 'Food Made Good' rating of 3 stars by the Sustainable Restaurant Association. They continuously strive to remain as green as possible, even harvesting their own honey from their Eden beehives!

WATER

Push-button taps are used in our bathrooms as a great way of saving water as they ensure taps are never left on.

When bottled water is required, we use Belu, a brand which is committed to a sustainable and environmentally friendly business model. All of the bottles we provide are made from recycled glass or plastic and these are then recycled by us.

A water saving measures have been installed in our public bathrooms including waterless and eco flush systems.

MATERIALS AND WASTE

We are dedicated to driving down our single-use plastic in as many ways as possible, including offering our mains fed filtered water machines as a place to refill water bottles. However we no longer offer plastic cups to fill from.

All members of staff are trained to work in the most sustainable way possible, minimising the use of energy and production of waste wherever possible. All printers are set as default to print on both sides of the paper and in black and white. All headed stationery is printed in-house as and when required to minimise wastage.

Printers are set to print only after a user request has been confirmed via code to avoid unnecessary printing.

We recycle glass, paper, ink/copier cartridges and batteries via a recycling company with exceptional green credentials.

Individual desk bins have been replaced with centrally located collection points on each floor throughout the building with clear signage.

Sachet-based cleaning and sanitising products are used throughout the building. By switching to a 'green' supplier, this has enabled us to cut out single-use plastic throughout our cleaning regime. It has also reduced our carbon footprint by cutting out bulky deliveries of cleaning products.

AIR QUALITY

All rooms feature automatic ventilation, which ventilates the room based on the number of people occupying it.

The efficiency performance air conditioning equipment is checked on a regular basis. Air quality reports are reviewed annually, and recommendations are acted on.

TRANSPORT

There is no parking on-site, instead staff, visitors, members and clients are encouraged to use public transport.

ENERGY

We use ecological suppliers.

Temperature control is managed centrally to ensure efficient heating and cooling throughout the building. Each meeting room can be controlled separately, ensuring we only heat rooms in use.
